

# RENNOVA ELEVATOR FLOOR ANNOUNCEMENT SYSTEM

An elevator floor audio annunciator, also known as a voice announcement system, is a feature commonly found in elevators that provides auditory cues to indicate the current floor. It is designed to assist passengers, especially those with visual impairments, in identifying the floor they are on and navigating within a building. It also has pleasant Background music during a lift in operation.

When the elevator arrives at a floor, the audio annunciator automatically announces the floor number or name. It uses pre-recorded Human voices as announcements. The audio is typically played through speakers installed within the elevator cabin.

The elevator floor audio annunciator may also provide additional information such as the direction of travel (up or down) and any special announcements or warnings. For example, it can inform passengers about emergency situations, warnings like "Please Close the Door", and "The lift is overloaded", etc., and Special Message announcements like Power Failure, ARD activation, Lift Overload, etc.,.

By providing audible cues, the audio annunciator enhances accessibility and ensures that passengers have the necessary information to navigate safely and confidently within the elevator. It helps create a more inclusive Background music and improves the overall user experience for all individuals using the elevator, regardless of their visual abilities.

The announcements can be customized as per customer requirements. Customers also can change the message announcements and music as per their needs.

# RENOVA ELEVATOR FLOOR ANNOUNCEMENT SYSTEM

## Specifications:

- Input Voltage: 12-24 Volt DC
- Dual volume controls for background music and voice announcements
- Multiple Language options available
- Floor Announcements up to 72 floors
